Total sFLT1: sensitivity to Ligand co-degradation
Same fraction for VEGF and PlGF; 100 pM degrader, 25% destruction/event; background half-life 1 day
Total sFLT1 (ng/mL)
Time after treatment starts (days)
25%
50%
75%
100%
Untreated steady-state baseline
Scenario curves overlap: total sFLT1 turnover is unchanged by these ligand parameters.
Production recalibrated to initial untreated steady state for each scenario; all other parameters held at current defaults.
Vertical scales differ across plots. Model predictions; storage pools are exploratory assumptions.
