Total sFLT1: sensitivity to Free VEGF half-life
Single dose: initial clearance 2/day, degrader half-life 3 days; 25% co-degradation

Untreated steady-state baseline
Scenario curves overlap: total sFLT1 turnover is unchanged by these ligand parameters.
Production recalibrated to initial untreated steady state for each scenario; all other parameters held at current defaults.
Vertical scales differ across plots. Model predictions; storage pools are exploratory assumptions.
